Patient Name	: KHAJAVEER MULIMANI	OP/Bill No.	: 000000873891
Accession Number	: 20114311	Result Date	: 27-Nov-2024
Age	: 53 Years	Sex	: M
IPD No.	:	Study No.	: 8476

*K/C/O Bronchopneumonia, S/P Cardiac Arrest.***MRI - BRAIN****Protocol**

3 plane localizer. DWI 1000B.
Axial T2W FLAIR. Axial T2W propellar. Axial T1W, FLAIR.
T1W Sagittal. T2W coronal.

Findings :-

Areas of diffusion restriction with FLAIR hyperintense signal and no evidence of GRE blooming noted predominantly in bilateral fronto parietal, temporo-occipital and bilateral thalami.

Mild diffuse cerebral parenchymal atrophic changes noted in the form of widened CSF spaces.

Mild chronic small vessel ischemic changes noted in bilateral periventricular white matter.

Rest of the cerebral cortex and underlying white matter are unremarkable.

The deep nuclei are unremarkable.

The cerebellum and brainstem are unremarkable.

The ventricular system and the basal cisterns appear normal.

There is no shift of the midline structures identified.

The intracranial ICA and vertebro-basilar arteries reveal normal flow void.

Impression:

Areas of diffusion restriction with FLAIR hyperintense signal and no evidence of GRE blooming predominantly in bilateral fronto-parietal, temporo-occipital and bilateral thalami---hypoxic ischemic insult.

Mild diffuse cerebral parenchymal atrophic changes in the form of widened CSF spaces.

Mild chronic small vessel ischemic changes in bilateral periventricular white matter.

Kindly correlate clinically & with other investigations.

Dr. ANIRUDH
