

Medical Report

Patient: José Luiz de Seixas Corrêa
Date of Birth: 11/25/1946
Age: 78 years and 8 months

1. Neurological History

- 2005: Diagnosis of Parkinson's disease.
- 2018: Underwent deep brain stimulation (DBS-STN) surgery, with good initial motor and cognitive response.
- 2022–2023: Experienced significant motor deterioration, with recurrent pneumonias and severe dysautonomia related to Parkinson's disease.
- September/2024: Evaluated at the Neurological Campus of Torres Vedras (Portugal). Started treatment with subcutaneous Duodopa infusion pump (fosfolevodopa/carbidopa), showing satisfactory motor and cognitive improvement, regaining the ability to walk without a wheelchair.
- Following the initiation of the infusion pump, the patient developed worsening orthostatic hypotension due to dysautonomia, and is currently on regular Midodrine and Fludrocortisone therapy.

2. Clinical Events

- February/2024: Hospital admission for cardiac pacemaker implantation due to symptomatic bradycardia.
- April/2024: Progressive muscle mass loss and weight loss observed.
- July/2024: Hospitalized for pneumonia.
 - Chest CT findings: moderate right pleural effusion and a large peritoneal mass.
 - Biopsy: consistent with Diffuse Large B-Cell Lymphoma, non-germinal center subtype (report attached).
 - PET-Scan: uptake restricted to the abdominal mass.

3. Hematological Treatment

- Due to the patient's frailty, a palliative treatment approach was chosen.
- 08/14/2024: Initiated therapy with Rituximab + Ibrutinib 420 mg/day.
- Initial response favorable, with no significant adverse effects.
- 09/04/2024: Second dose of Rituximab scheduled.

4. Current Status

- Patient is debilitated, with marked weight loss and severe muscle weakness, unable to stand without assistance.
- Requires continuous use of a wheelchair.

5. Personal History

- Lifelong amateur athlete, long-distance runner, completed 5 marathons and several shorter races.
- Smoking history: quit at age 32.
- Alcohol intake: mild, social, limited to weekends.
