

A.J. Institute of Medical Sciences Hospital

GF - 08

BIOPSY NUMBER: -
HP/ 3557 /25

PATIENT'S NAME : MR. SHESHAGIRI Y N
AGE : 66 YEARS
SEX : MALE
DATE & TIME OF RECEIPT: 21 /05 /2025

HOSP NO : 2549752
WARD : OP
DOCTOR/UNIT : Dr. Vishwas Pai
DATE & TIME OF DISPATCH: 23 /05 /2025

HISTOPATHOLOGY

NATURE OF SPECIMEN: - TISSUE FROM THE GROWTH

GROSS FEATURES: - Received multiple fragmented grey white soft tissue bits
altogether measuring 1.5x1x0.4cm
All embedded in 2 blocks: A, B.

MICROSCOPY: - A,B: Section shows mucosa lined by dysplastic squamous epithelial cells with an infiltrating tumor composed of tumor arranged in sheets, cords and nests. These tumor cells are polygonal with high N:C ratio, coarse chromatin with prominent nucleoli and moderate amount of eosinophilic cytoplasm. Individual cell keratinization is seen. Keratin pearls are absent. Mitotic figures are noted. Stroma shows chronic inflammatory infiltrate.

PRESSION:- Tissue from the growth : Moderately Differentiated Squamous Cell Carcinoma.

Grossing done by: Dr. Unnatha B Shetty

Microscopy reported by: Dr. Unnatha B Shetty

Note:

1. Correct identification of specimen by name of patient, age, sex, ward no, unit should be written on histopathology form and specimen by clinicians.
2. Specimens will be preserved for 1 month only.
3. For issue of histopathology slides, blocks or specimens, correct histopathology no should be given on requisition form.

A UNIT OF LAXMI MEMORIAL EDUCATION TRUST (R)

HEALTH - HOPE - HAPPINESS

IMPRESSION:

- ~ 2.8 x 2 x 2.7 cm enhancing lesion involving the right lateral border of tongue (posterior aspect) and tonsillar fossa with extensions as described, consistent with malignancy.
- 1 x 0.7 cm level IA node and few oval right level IB and II nodes with cortical thickening as described, indeterminate.
- Other CT findings as described above.

Dr Rithi Melissa D'Silva,

Date	29.05.2025	Referred By	Dr. Krishna Prasad

CT FACE AND NECK WITH INTRAVENOUS CONTRAST

INDICATION: Known case of carcinoma right lateral tongue.

FINDINGS:

Enhancing lesion is noted involving the right lateral border of tongue, predominantly in posterior 3rd aspect with mild extension to mid 3rd of tongue, measuring ~ 2.8 x 2 x 2.7 cm (AP x TR x CC) (Image # 186; series # 6).

- Posteriorly, It extends to tonsillar fossa upto tonsilo-glossal sulcus.
 - Laterally, it extends to gingivo-lingual sulcus. Enhancement extends to inferior aspect of medial pterygoid, suspicious for infiltration. It abuts the adjacent RMT.
 - Superiorly, mild extension of enhancement to the soft palate on right side.
- There is pooling of secretions in the posterior gingivobuccal/ gingivo-lingual sulcus.

1 x 0.7 cm level IA node with cortical thickening.

Few oval right level IB and II nodes with mild cortical thickening, measuring upto 1.5 x 0.6 cm (Image # 209; series # 6 measured in sagittal plane).

Small calibre left cervical nodes, not significant by size.

Moderate mucosal thickening in maxillary and ethmoid sinus.

The nasopharynx and hypopharynx are unremarkable.

The supraglottic including epiglottis and aryepiglottic folds, vocal cords, infraglottic larynx and upper trachea are unremarkable.

The parapharyngeal, thyroid, submandibular, parotid and posterior cervical spaces are unremarkable.

The superficial soft tissues of the neck are unremarkable.

The mastoid air cells and visualized paranasal sinuses are clear bilaterally.

Visualized neuroparenchyma is unremarkable.

Mild emphysematous changes in right upper lobe.

Mild degenerative changes in spine.

Mild erosive changes are seen in D1 vertebral body on right side, adjacent to costo-vertebral junction, appears benign. Recommend follow up.

The osseous structures are otherwise unremarkable.
