Gallium-68 DOTANOC PET-CT Scan

PROTOCOL: 1.8 mCi Gallium-68 DOTANOC was injected after 4 hrs fasting. PET-CT scan was performed 45-60 min after the injection on SIEMENS Biograph mCT 20 Time of Flight PET-CT scanner. Semi-quantitative analysis of DOTANOC uptake was performed by calculating SUV value based on body weight. A separate breathhold CT was also acquired. Extent of the scan: Vertex to mid-thigh.

INDICATION: Case of NET - pancreas. Status post distal pancreatectomy, splenectomy, pancreaticojejunostomy, Roux-en-y jejunostomy on 17.10.2020. Received 6 cycles chemotherapy (last on 16.04.2021). Now presented with suspected recurrence. For reassessment.

FINDINGS:

PRIMARY SITE:

Status post distal pancreatectomy, splenectomy, pancreaticojejunostomy, Roux-en-y jejunostomy noted.

The residual head and body of the pancreas appears normal.

Increased DOTANOC uptake is noted in the soft tissue mass noted in the left retroperitoneum, measuring 2.9 x 4.6 cm, SUV max 17.87 . It is mildly infiltrating into the upper pole of left kidney. It is also involving the left crus of diaphragm.
Increased DOTANOC uptake is noted in left para-aortic node, measuring 1.1 x 1.4 cm, SUV max 11.16.

BRAIN:

No focal DOTANOC uptake or obvious enhancing lesion noted in the brain parenchyma. Ventricles and CSF spaces appear unremarkable.
No mass effect or midline shift noted.

NECK:

The nasopharynx, oropharynx and hypopharynx appear unremarkable.
The tonsillar fossa appears unremarkable.

Patient ID	MR501114	Patient Name	Mrs. VEENA H KALLOORAYA
Gender	Female	Age	68Y
Study Date	03-06-2025	Study Type	CT
Ref Physician	DR KRISHNA PRASAD	Order No	

The thyroid appears normal.
The IJV and carotid arteries appear unremarkable.
No significant cervical lymphadenopathy noted.

THORAX:

No lung nodules seen.
No significant mediastinal lymphadenopathy noted.
No pleural effusion is seen.
The heart and mediastinal vessels appear unremarkable.
No pericardial effusion noted.

BREASTS:

Bilateral breasts appear normal.

ABDOMEN:

The liver appears normal in size and shape showing physiological DOTANOC uptake.
No IHBR dilatation noted.
The portal vein appears normal.
The stomach and bowel loops appear unremarkable.
Bilateral adrenals appear normal.
The right kidney appears normal in size and shape.
The descending aorta and IVC appear unremarkable.

PELVIS:

Post hysterectomy status is noted.
Urinary bladder appears partially distended.
No significant abdominopelvic lymphadenopathy noted.

MUSCULOSKELETAL SYSTEM:

The axial or appendicular skeleton appears unremarkable.

Rest of the whole body scan appears unremarkable and shows physiological tracer distribution.

IMPRESSION:

Case of NET - pancreas. Status post distal pancreatectomy, splenectomy, pancreaticojejunostomy, Roux-en-y jejunostomy on 17.10.2020. Received 6 cycles chemotherapy (last on 16.04.2021). Now presented with suspected recurrence. For reassessment.

Scan findings reveal:

- Status post distal pancreatectomy, splenectomy, pancreaticojejunostomy, Roux-en-y jejunostomy noted.
- Somatostatin expressing soft tissue mass noted in the left retroperitoneum, mildly infiltrating into the upper pole of left kidney and also involving the left crus of diaphragm - likely to represent recurrent disease.
- Somatostatin expressing left para-aortic node is noted - likely to be metastatic.
- No evidence of active somatostatin expressing disease elsewhere in the body.

The above scan findings are suggestive of disease recurrence.
